

SAP Master data validator

Are you familiar with these problems?

Do you have a data migration, e.g. to S/4, ahead of you and don't know what level your master data quality is at?

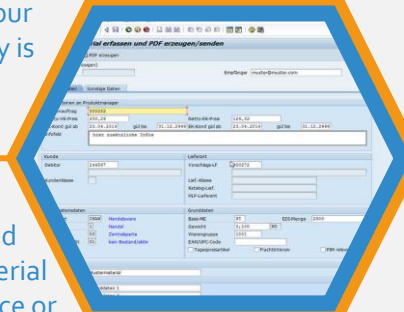

Are you missing the overview?

Do you want to automate processes but do not trust the master data quality?

Do you have limited knowledge of material master maintenance or only one or a few experts in your company?

Do you check relevant dependencies in your master data?

Are processes interrupted because master data is missing or inconsistent?

Master data validator

When and why should you think about professional handling of your master data quality?

If you manage more than 1000 material masters, it quickly becomes confusing: missing views, wrong values in the optional fields, value entries that do not match other fields, missing bill of materials and routings for materials, etc.

Imagine they could save process costs through automation. This requires correct and consistent master data. Even if you are not necessarily aiming for automation, missing and incorrect master data is a nuisance. Processes are interrupted and require manual corrections. Such sources of error cause costs.

Often there are only a few employees in companies who have an overview of the master data. Relieve these employees with a systematic storage of the logic via BRF+ rules. Keep systematic knowledge in your company independent of employees.

Are you planning your S/4 migration? Here, too, it is advisable to keep the master data quality high in order to avoid unexpected problems during the migration to S/4.

Your master data deserves attention!

Our solution offer

The **Master Data Validator** supports you in keeping an overview of your master data. Our product is an SAP standard report, which is available for SAP Release ECC 6.0, Netweaver 7.0, EP2, SP6 and of course also S/4 HANA capable.

The **Master Data Validator** already contains a complete set of validation rules (BRF+) that can be used in any company. You can adapt these rules yourself at any time or add more. No programming knowledge is required for this.

Defects are determined via these rules and displayed in an overview via a traffic light system. From this overview you can jump directly to the material master, the bill of material, the routing or the purchasing info record and make changes or carry out a mass change.

Of course you can select and sort materials in the usual scope over all fields. In addition, a selection via change numbers for material, bill of materials and routing is possible, as well as a complete bill of material explosion including routing.

Our Offer Master data validator

One-time license
CHF 15'000

Annual maintenance
(21% of the one-time license)
+ access to updates and
guaranteed release capability
CHF 3'150
